

From rocks to sand

Waves roll rocks and boulders backward and forward on the shore. The boulders break into pebbles and then into tiny grains of sand. This change takes hundreds or thousands of years.

Shifting sands

Dunes are made of sand blown into low hills by the wind.

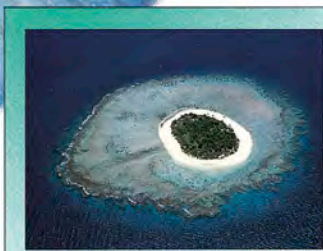

An estuary is the place where a river flows into the sea.

Sea cliffs are one of the best places to see the different layers of rock.

Mud flats and marshes

Waves can build sand, mud, and pebbles into a long strip of new land. It is called a spit.

Living rock

Coral is found in warm, sunny, shallow seas. It is made by tiny sea creatures that look like flowers. Over thousands of years, their skeletons build up into huge coral reefs and islands.
