

BUILDING

Taipei 101

The invention of new materials and new ways of building has enabled cities to shoot up into the sky. Skyscrapers are not held up by wood, brick, or stone walls, but by strong steel skeletons on which walls and windows are

simply hung like curtains. One of the tallest office buildings in the world is the Taipei 101 in Taiwan, which was built in 2004. It has 101 floors and stands 1,670 feet (509 meters) tall.

Concrete creation

Many modern buildings, such as the Sydney Opera House, are made of concrete. This artificial rock is made by roasting clay and limestone to make cement, and then adding sand and water. Stretched steel cables inside the concrete stop it from cracking.

There are around 26,000 hand-cut glass panels covering the tower, which are all cleaned by hand, too!

Growing up

The tallest building in the world is the Burj Khalifa, in Dubai. It is 2,700 feet (830 meters) to its spire, and has more than 160 floors. Construction on it began in 2004 and it was finished in 2010.

Three different entrances on three sides take you to three different floors of the spiral-shaped building.
