

At the controls

The control center for Eurostar is in contact with the driver of every train. Controllers can warn the driver about any problems ahead, such as delays, signal failures, and electrification faults. In this way, the control center keeps the rail network running as smoothly as possible.

Grand Central Station

The largest railroad station in the world is Grand Central Station in New York. It has two levels with 41 tracks on the upper level and 26 tracks on the lower one.

A typical ICE has eight coach cars with 16 power motors and can carry up to 500 passengers.

The streamlined shape of electric trains helps them speed along. In tests the ICE has reached 215 mph (345 kmh).

Coast to coast

One of the great railroad journeys of the world crosses Australia, from Sydney to Perth. The route covers 2,466 miles (3,968 kilometers) in three days and includes a world record 297 miles (478 kilometers) of completely straight track!

On the tracks

A variety of engines and freight cars use the railroad tracks of the world today.
