

NEPTUNE

Inner solar
system

Blue Neptune

The Voyager 2 spacecraft took photographs of Neptune's clouds and its storm, called the Great Dark Spot.

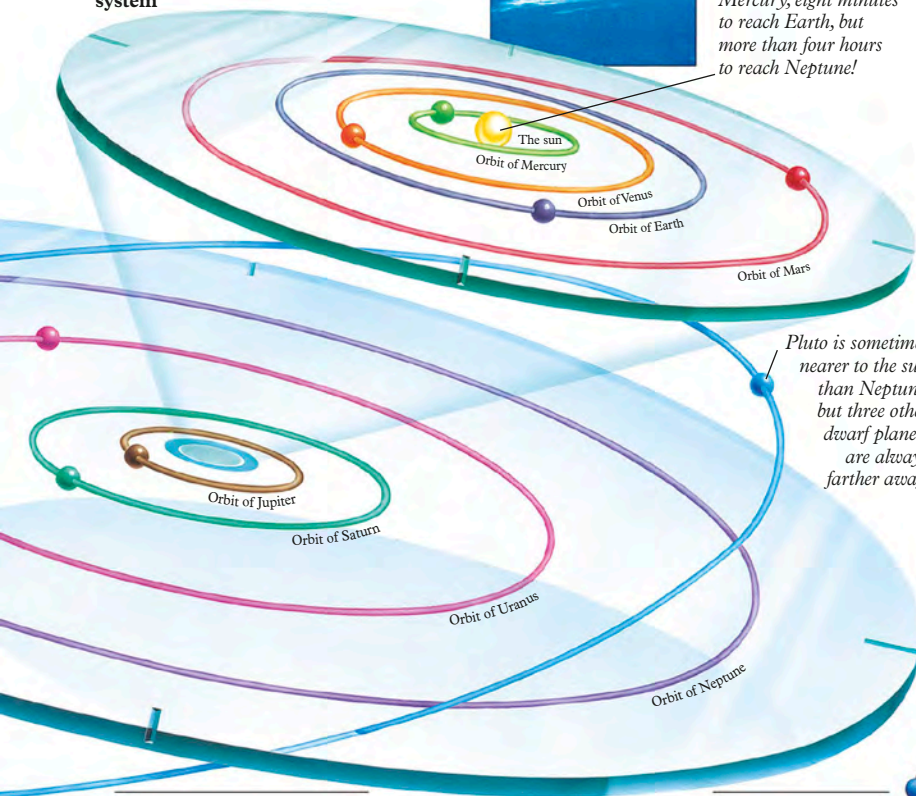

PLUTO

Cold dwarf!

The dwarf planet Pluto is smaller than our moon. At night it is 10 times colder than a freezer!

Light from the sun takes three minutes to reach Mercury, eight minutes to reach Earth, but more than four hours to reach Neptune!

Pluto is sometimes nearer to the sun than Neptune, but three other dwarf planets are always farther away.
