Sea hedgehogs

Sea urchins are close relatives of starfish. Their long spines, which are sometimes poisonous, make them look like hedgehogs.

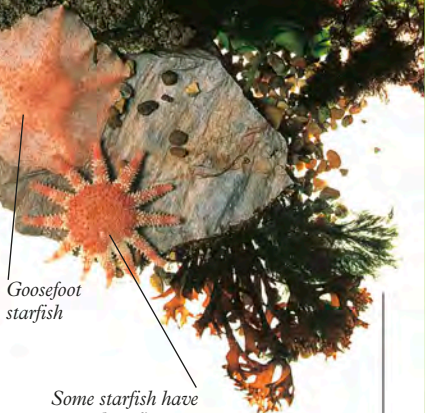

Armless

This starfish is growing two new arms. The old ones were bitten off by a fish! As long as the central disk and one arm is left, the starfish will survive.

New arm

Goosefoot
starfish

Some starfish have more than five arms. This spiny sun star has twelve!

Spiny species

There are more than 7,000 different species of echinoderms, but only five main groups.

Starfish

Brittle stars

Sea urchin

Sea cucumber

Sea lily

Most starfish have five arms.

If a starfish flips over, it pulls itself the right way up with its arms.

Tube foot

Each of these feet has a sucker on the end which helps the starfish stick to rocks and catch food.

Flip side

It is easy to tell which way up a starfish or a sea urchin is—its mouth is always underneath.
