

Skin colour

The colour of your skin is affected by a substance called melanin. The more melanin you have, the darker you will be. When you are outside in the sun, your body produces extra melanin to protect your skin. This melanin makes your skin darker and you get a suntan.

If you uncurled a sweat gland, it could be over a metre (3 ft) long.

your body is on the soles of your feet.

Soggy skin

When you soak in water for a long time, the top layer of your skin gets waterlogged and wrinkly.

Cooling down

When sweat dries on your skin, it helps to cool you down. Sweat comes from coiled tubes under the surface. It gets out through tiny holes called pores.
