110-111 Breathing
116-117 Eating and digestion

Acid attack

Glands inside your stomach make acid, which kills germs you've swallowed. Your digestive system then breaks down the germs along with your food.

Your skin.

Slimy guts

The inside of your intestines are covered with slimy mucus, which stops germs from getting into your blood. Your large intestine also contains millions of "friendly" bacteria, which prevent other germs from growing.

Yuk!

The feeling of disgust protects you from germs. Anything that smells revolting or looks horrible is probably full of germs. Disgust stops you from touching it.
