

Links in a chain

Food chains connect a species with what it eats.

Leaves act like solar panels to gather sunlight to make food.

Caterpillars – and many other insects – chew on leaves. That's their food.

Birds hunt caterpillars, especially in spring when they have chicks to feed.

Foxes prey on birds, small mammals, and other creatures.

Maple leaf

A leaf is a tree's food factory. In autumn, it begins to shut down.

Autumn colours

In the growing season, deciduous leaves appear green because of a chemical called chlorophyll. In autumn, the leaves turn yellow, brown, or red as the chlorophyll is destroyed.

Woodpeckers have thick skulls to protect against the shock as they hammer into wood.

Woodpecker

Making an entrance

Woodpeckers use their beaks to dig out grubs and to make nest holes. They have amazingly long tongues to probe and seek out insects.

Trees as homes

Woodpeckers take two to three weeks to dig out a nest hole, into which the female lays several eggs. The hole is usually in a dead tree.

When mature, a fern bud unrolls and the leaflets open out.
