

Dandelion
seeds

The flower is ready to be pollinated by an insect.

From flower to seed

Dandelions are frequently seen in meadows, as they have a way of spreading their seeds that is incredibly successful. Each seed has a parachute, to carry it far away.

The petals have died and the parachutes are forming.

A breeze lifts the parachutes. They may travel far.

Bubble blower

Froghopper nymphs create damp bubbles of sticky fluid to stop themselves from drying out.

The bubble also protects the nymphs from being eaten.

Harvest
mouse

Tiny monkeys

Harvest mice climb through the stems as ably as monkeys climb through trees. They build tennis ball-sized nests.

A harvest mouse weighs no more than a teaspoonful of sugar.

Slow but steady

The slow worm is not actually a worm – it's a type of lizard, but it has no legs! This one is hunting for a tasty worm or a snail.

There are many different types of snails and a meadow is a good place to find a selection.

Slow
worm

It can live for more than 50 years.
