

Eggstraordinary eggs

Scientists have been lucky enough to find lots of fossilized dinosaur eggs, and even nests. There is a huge variety of sizes and shapes, from small, circular eggs that would fit into the palm of your hand to eggs the size of cannonballs.

The largest?

This massive egg was found in China and is thought to have been laid by a *Therizinosaur*. There were larger eggs – the largest was laid by a dinosaur called *Macroelongatoolithus*.

This dinosaur egg fossil is from Mongolia.

A muddy home

Some eggs were laid in mud, which proved a perfect base for fossilization. These are *Maiasaura* eggs from Montana, USA.

Shaped like an egg?

Some dinosaur eggs were round, but others were elongated, rather like a loaf of bread.

This is a hen's egg; it shows just how large the *Therizinosaur* egg was.

Oviraptor nest from China, showing the eggs laid in a spiral pattern. Each egg is approximately 16 cm (6 in) long.
