

Eggstraordinary eggs

I'm making a break for it!

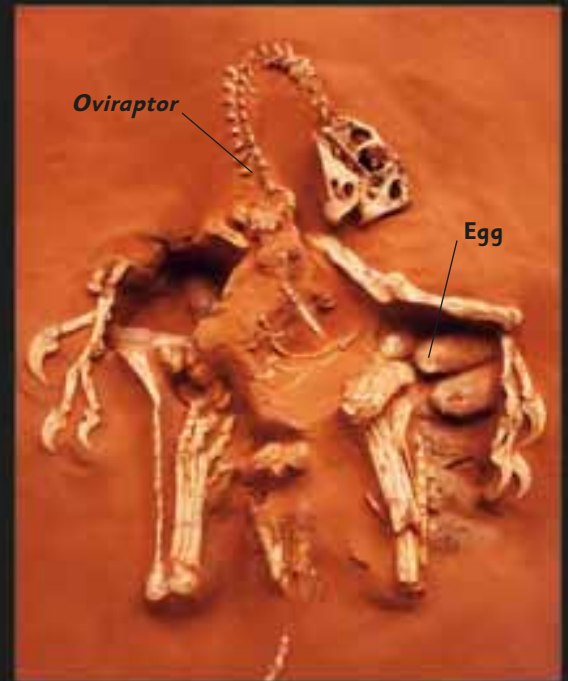

A tiny dinosaur hatchling breaks out of its egg casing. While some dinosaurs were probably ready to look after themselves after hatching, others would have depended on parental help for food and protection.

Fossilized
dinosaur egg

This is a model of a
Parasaurolophus hatchling.

Egg care?

Did dinosaurs sit on their eggs, like birds today? Some did; this *Oviraptor* died and was fossilized sitting on her eggs some 80 million years ago.

Become an expert

206-207 How
was it made?

Oviraptor

Nest is dug out
of sand or earth.

Bringing it back to life

This model recreates the fossilized scene above, showing the *Oviraptor* shielding her eggs. *Oviraptors* had curious-looking beaked snouts. They may have raided other nests for food for themselves and their young.

No. They had hard, brittle shells, like the eggs of birds.
