

Living dinosaurs

You may think that reptiles are closely related to dinosaurs, but dinosaurs may have more in common with birds!

A hidden link?

The link between dinosaurs and birds is a puzzle. *Caudipteryx* appears to have been a combination of bird and dinosaur.

Caudipteryx would not have been able to fly as its wings were too small.

The first bird?

The earliest-known bird is *Archaeopteryx*, which first appeared in the Jurassic period. It had the toothed head, clawed fingers, and long bony tail of a dinosaur, but it also had feathers.

Fossilized
Archaeopteryx

Archaeopteryx means "ancient wing".
