

Movement energy

Rollercoasters start from the top of a hill, where their height gives them a lot of potential energy. As they move downhill, the potential energy turns into movement energy (kinetic energy), making them go faster and faster.

Nuclear energy

Matter is made up of tiny particles called atoms. The centre of an atom, called a nucleus, stores huge amounts of energy. This nuclear energy is used in power stations to make electricity.

Electrical energy

Lightning is caused by electrical energy in a storm cloud. The electrical energy turns into the heat and light energy of lightning and the sound energy of thunder.

Chain reactions

Changing energy from one type to another is called "energy conversion". The steps can be linked to make an energy chain.

Coal contains chemical energy.

Burning coal produces heat energy, which is used to boil water. Boiling water creates steam.

Moving steam is a form of kinetic (motion) energy, which operates turbines.

The kinetic energy produced by the moving turbines creates electricity.

Electrical energy used by television sets changes into light, sound, and heat energy.
