

Circuits of power

An electric circuit is a loop that electricity can travel around. An electric current moves through the wires in this circuit, and lights up the bulb.

Circuits usually include an energy source (battery) and load (lamp).

Hands on

Rub a party balloon up and down on your clothes. The balloon will now stick to the wall. This is because rubbing it gives the balloon an electric charge.

Lightning strikes

When electricity builds up in one place it is called static electricity. A bolt of lightning is a huge spark of static electricity in the sky.

High voltage

Electricity can be very dangerous. This triangle is an international warning symbol. It means "Caution: risk of electric shock".

Food battery

Food that contains water and weak acid will conduct electricity. In a food battery, a chemical reaction between the metal and the acid in the food creates an electric current.
