

What's it made of?

The Earth is made up of an outer thin crust. Under this is molten rock. In the middle is a solid core.

The crust

The Earth's crust is cracked into lots of huge pieces called plates. The cracks are called fault lines.

The San Andreas fault, California, USA

Mountains and valleys

Most mountains are made when rocks are pushed upwards by movements of the Earth's crust. Blowing winds, flowing rivers, and glaciers wear away the mountains.

Sedona, Arizona, south-western USA

Curiosity quiz

Look through the Planet Earth pages and see if you can identify each of the picture clues below.
