

Resources in the ground

The ground holds many useful things, from fuels like coal and oil, to drinking water, and building materials. These valuable items are known as resources and we have dug, drilled, and searched for them for many years.

Finding fuels

Oil and gas are often found in pockets deep underground. Sometimes, these are even below the seabed. Coal develops closer to the surface in layers called seams.

Deep drilling

Oil rigs far out at sea use huge drills to extract the liquid oil from the ground. Coal is solid and is dug out in mines or pits.

In hot water

Water in the ground can get very hot near volcanoes. In Iceland, they use this naturally hot water to heat houses or make steam to turn electricity generators.
