

The water cycle

Water is constantly on the move, between oceans, land, air, and rivers. This movement is called the water cycle.

Natural recycling

The water cycle is the journey water makes as it moves from the air to the land, into the seas, and back into the air again.

On the dry side

Moisture-laden sea air has to rise when it hits a coastal mountain.

Since air cools as it rises, all the moisture condenses into rain. So, on the other side of the mountain, no rain falls – this area is called a rainshadow.
