

Apollo 11 reached the moon because of a huge rocket called *Saturn V*. Most of *Saturn V* contained the fuel needed to blast it into space. Three astronauts sat in a tiny capsule at the top of the rocket.

Moon journey

During the 1960s there was a race between the USA and the former Soviet Union to put a man on the moon. The USA landed the first man on the moon with *Apollo 11* in 1969.

10 The service module is ejected before re-entry into Earth's atmosphere.

9

The journey back

11 The command module is the only part of the mission to return to Earth.

1 Five F1 engines blast the *Saturn V* rocket into space from the Kennedy Space Center.

The journey out

3 The command and service modules separate from the rocket and perform a 180° turn.

12

Command module

13

2 The rocket's engines fire to set the craft on a course to the moon.

The service module contained the power and life-support systems.

What was *Apollo 11*?

Apollo 11 was made up of three modules, or parts: the tiny command module, the service module, and the lunar module.
