

The Earth is like a spaceship traveling through space. As it orbits the Sun, it is moving more than 100 times faster than a jumbo jet!

Bright lights glow across the sky.

Light fantastic

The Sun blasts out particles, or tiny pieces, which enter Earth's atmosphere and create amazing light displays. These displays can be seen in the sky toward the North and South Poles. They are known as the northern and the southern lights.

Earth is made up of several layers.

Story of the Earth

Earth is about 4.5 billion years old. In the beginning, it was so hot that most of its metals and rocks melted. Over time, the outer layer cooled to form a solid crust and the metals sank to the Earth's center. As the Earth cooled, steam fell as rain and formed the oceans.
