

Jupiter

Gigantic Jupiter is made mostly of gas and liquid, with a small rocky core, or center. Jupiter has a cloudy outer layer with dark bands and bright zones of different colors. The cloud tops reflect sunlight well, so the planet shines brightly in our sky.

Jupiter's journey

Jupiter can be mistaken for a bright silver-white star in the night sky. It moves slowly against the starry background, and you can watch its progress from week to week. It takes about a year to travel through each zodiac constellation.

Stormy weather

Jupiter spins around very fast. This produces high-speed winds and terrific storms. These are much bigger and longer-lasting than storms on Earth. The Great Red Spot storm has been raging for at least 300 years!

Jupiter's cloud layer is icy cold. However, the planet gets hotter and hotter toward the center.

Europa

The Great Red Spot is the biggest storm in the Solar System.
