

Andean mountains

The Andes is one of the highest mountain ranges in the world. It reaches a top height of 22,831 ft (6,959 m) and stretches along the west coast of South America. Animals here have to cope with extreme habitats, from glaciers to tropical forests.

The Peruvian firestick eats ferns.

The bright-red color of this stick insect warns predators to stay away. If threatened, it releases a nasty-smelling liquid.

Found in mountain woodlands, this nonvenomous snake can grow to 6½ ft (2 m) long.

This is South America's only bear. It looks like it wears glasses because of the lighter-colored fur on its face.

The northern pudu is the tiniest deer in the world at just over 12 in (30 cm) tall.

Only found in Lake Titicaca, this huge frog weighs up to 2.2 lb (1 kg) and breathes through its baggy skin.

These domestic animals live in groups in high mountain areas, where they eat hay, grass, and ferns.

Also called a cavy, this wild guinea pig lives in groups in mountain grassland and forest edges.

Lima

Location

The Andes stretch more than 4,500 miles (7,240 km) through seven countries. The climate here ranges from humid rain forest to snowy mountains.

The skin on this frog's belly is see-through—you can see its internal organs and even its bones!

This pale-pink flamingo gets its color from the plantlike algae that it eats, which grow in high, salty lakes.
