

The male cock of the rock can extend the crest on its head.

Andean cock of the rock

Male cock of the rocks are brilliant orange, while females are brownish. The males gather together to show off their feathers to females, who pick their favorite from the group.

Vicuña

These small members of the camel family are so well-adapted to their mountain homes that they can survive at altitudes as high as 16,404 ft (5,000 m).

HABITAT KEY

- Wetlands
- Deciduous forests
- Mountains
- Cold desert
- Scrublands
- Temperate grasslands
- Tropical grasslands

ARGENTINA

Caracaras often wander around, turning over stones to look for insects, rodents, and other animals to eat.

Mountain caracara

Santiago

Long-tailed chinchilla

With 60 hairs growing out of each follicle, this rodent has very thick fur. Having thick fur is ideal for the cold temperatures of the high Andes.
