

Africa

This continent is so large and has so many different habitats, it feels as if there are several Africas, not just one. With deserts and rain forests, mountains and grasslands, Africa is home to some of the best-known—and most endangered—species on Earth.

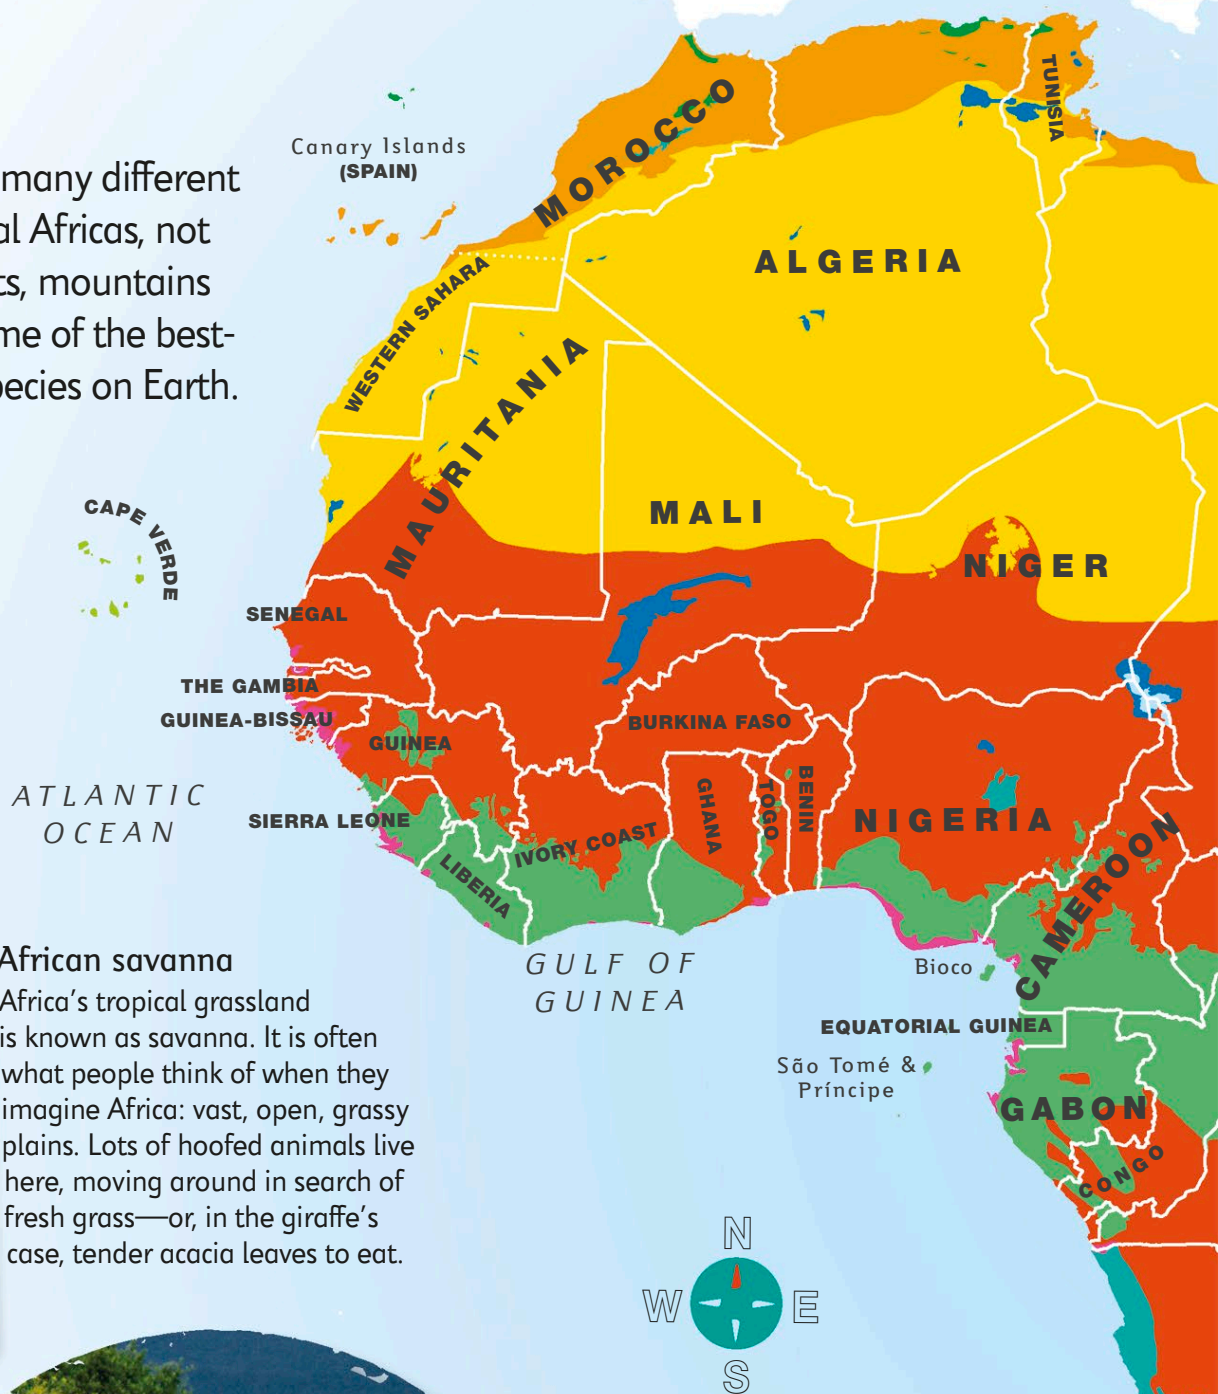

African savanna

Africa's tropical grassland is known as savanna. It is often what people think of when they imagine Africa: vast, open, grassy plains. Lots of hoofed animals live here, moving around in search of fresh grass—or, in the giraffe's case, tender acacia leaves to eat.

South African fynbos

The southwest tip of South Africa is covered with shrubs and heathland known as fynbos. Animals such as tortoises, frogs, and small baboons live among the 9,000 plant species that grow here. That's more plant species than in South America's Amazon rain forest!

HABITAT KEY

- Tropical forests
- Deciduous forests
- Coniferous forests
- Tropical grasslands
- Scrublands
- Deserts
- Wetlands
- Mountains
- Mangroves
