

Warm and soft

Touchy feely

Your **skin** is covered in tiny **sensors**, called **nerve cells**, that help you **feel** things.

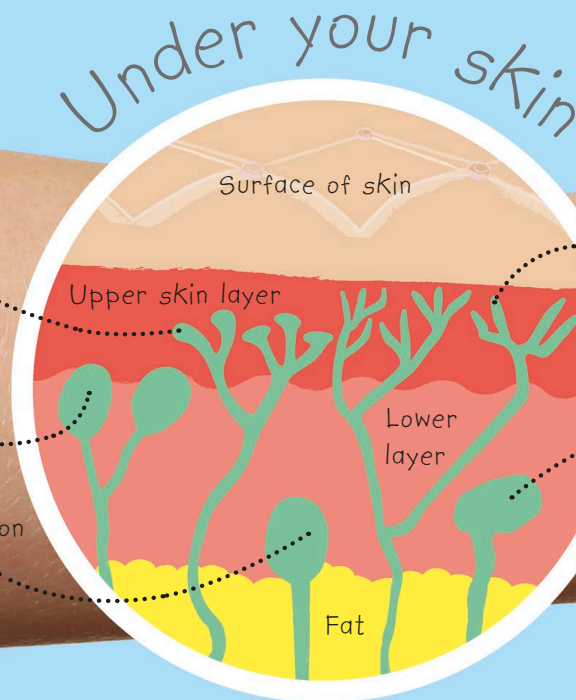

How do you feel?

When you touch something, the nerve cells in your skin send a message to your brain to tell you how it feels. Different types of nerves can feel different things.

Texture sensor

Light touch sensor

Vibration sensor

Pain sensor

Firm pressure sensor

Fat

Under your skin

What happens to your skin when you take a long bath?
