

Special senses

Your **senses** tell you about the **world around you**.

Did you know?

Your five main senses are touch, sight, hearing, taste, and smell. They help us understand what things are.

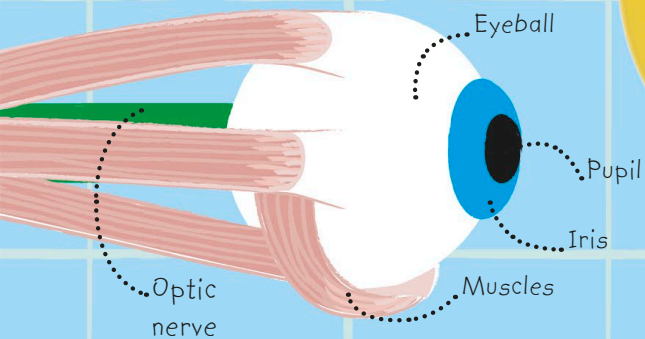

Look!

Your eyes help you see.

Light comes in through your pupil and hits nerves at the back of your eyeball. These tell your brain the shape and color of an object.

The optic nerve sends information about what you can see to your brain.

Eyebrows, eyelashes, and eyelids protect the eyes from germs, dust, water, and sunlight.
