

Cells

Body cells are so small they can only be seen under a microscope. Every type looks different because they all do different jobs. Nerve cells are long and thin, while skin cells are flat.

It's a person!

Your body relies on every cell, organ, and system to work as a team to keep you alive.

Organs

Organs are made of different types of tissue. Each organ has a job to do. For example, your liver's job is to clean your blood.

Systems

Organs work together in groups called systems. There are many different systems in your body. One of them is your digestive system, which takes nutrients from food to power your cells.

Did you know?

Everything in the whole universe is made up of atoms. Even you!
