

Brilliant blood

Your **blood** is your body's delivery system. It carries everything that your **organs** and cells need to work.

What's in your blood?

White blood cells help your body fight off germs.

Red blood cells carry oxygen to cells and organs.

Plasma makes blood runny and delivers nutrients where they are needed.

Sticky platelets stop you bleeding if you have a cut.

Did you know?

Blood is mostly made of clear plasma, but blood cells make it look red.
